## Executive Summary

Globally the health related issues are on rise. These health issues surround diseases, syndromes and disorders, etc. Many of these health issues can be detected early and can be tackled by a mere dose of medicine, but there are several others that get detected on the advanced stage and have no cure. Hence, scientists and doctors are trying to accommodate the use of advanced technology and apps in the field of medicine, thus bringing digital medicine and digital health at the doorstep via mobiles.

Digital health is a platform that combines technology with personal health and genetic information, so that healthcare could be made personalized and precise. Digital health includes consumer focused fitness apps that have little or no clinical validation for patients and physicians. Digital health has been classified into EMR/HER, mobile health, telehealth and wireless health.

Digital medicine is disease oriented healthcare, that is currently at nascent stage. Digital medicine is a subset of digital health. The concept of digital medicine revolves around studying and analysing the patient's health and accordingly prescribing the customised medical aid. It involves either a combination of drugs with therapeutic treatments or simply digital therapeutic treatments; thus, providing real-time health information to the patients and the corresponding healthcare team. The major focus of digital medicine is on curing or managing the disorders or diseases that have no cure by alternative drugs, such as type 2 diabetes, obesity, mental disorders, etc. The digital medicine has three phases namely, commercialization, combination therapies and stand-alone digital therapeutics.

The digital medicine is supported by various growth drivers, such as increased smartphone usage, growing software industry, mobile phone proliferation, increasing biopharma investments, rising healthcare expenditure, and increasing population with chronic diseases, etc. Yet the digital medicine market faces several challenges, such as lack of clinical evidence, narrow functionality of apps, huge time and capital to be incurred, and regulatory hurdles, etc.
